

ソ and ソ

082340544 HIRAO Momona

ソ and シ

- A kind of Japanese Katakana
- Difficult to distinguish

My interest

What features make ソ and シ different?

I tried to

- 1 **classify** images
- 2 **generate** images of them

KATAKANA CHART

THESE ARE THE BASIC FORTY SIX JAPANESE KATAKANA LETTERS

ア a	イ i	ウ u	エ e	オ o
カ ka	キ ki	ク ku	ケ ke	コ ko
サ sa	シ shi	ス su	セ se	ソ so
タ ta	チ chi	ツ tsu	テ te	ト to
ナ na	ニ ni	ヌ nu	ネ ne	ノ no
ハ ha	ヒ hi	フ fu	ヘ he	ホ ho
マ ma	ミ mi	ム mu	メ me	モ mo
ヤ ya		ユ yu		ヨ yo
ラ ra	リ ri	ル ru	レ re	ロ ro
ワ wa		ヲ wo		ン n

Datasets

Used handwritten and printed images from **the ETL Character Database**
(<http://etlcdb.db.aist.go.jp>)

1. Extracted only ヲ and ン images
2. Shaped images
 - Resized to 28×28
 - Reduced background noise
3. Shuffled them by characters
4. Separated to training and test data sets

Some images of the created dataset

Got **4800** training data and **1219** test data

Classify images

CNN with 2 convolution layers + dense layers

Since the amount of data was small, I used CNN which can extract features

I tried very simple CNN, as I did in Homework, but

- Used Batch normalization
- Changed optimizer from SGD to Adam

Structure of the CNN model

Classify images

Accuracy

was not stable?

→ because of the number of epochs?

Weights of the first convolutional layer

Look like there are a few differences

→ Did not train well / kernel was small?

Weights of the first convolutional layer

Generate images

CGAN (Conditional Generative Adversarial Nets)

Since I wanted to get images between \smile and \frown , I used the CGAN instead of a standard GAN.

Structure of the generator model

Structure of the discriminator model

Generate images

I mainly referred to <https://qiita.com/o93/items/96ca7dbcc82a8dd873ad>

And adjusted the model based on <https://github.com/soumith/ganhacks>

Epoch 0

Epoch 20

Epoch 40

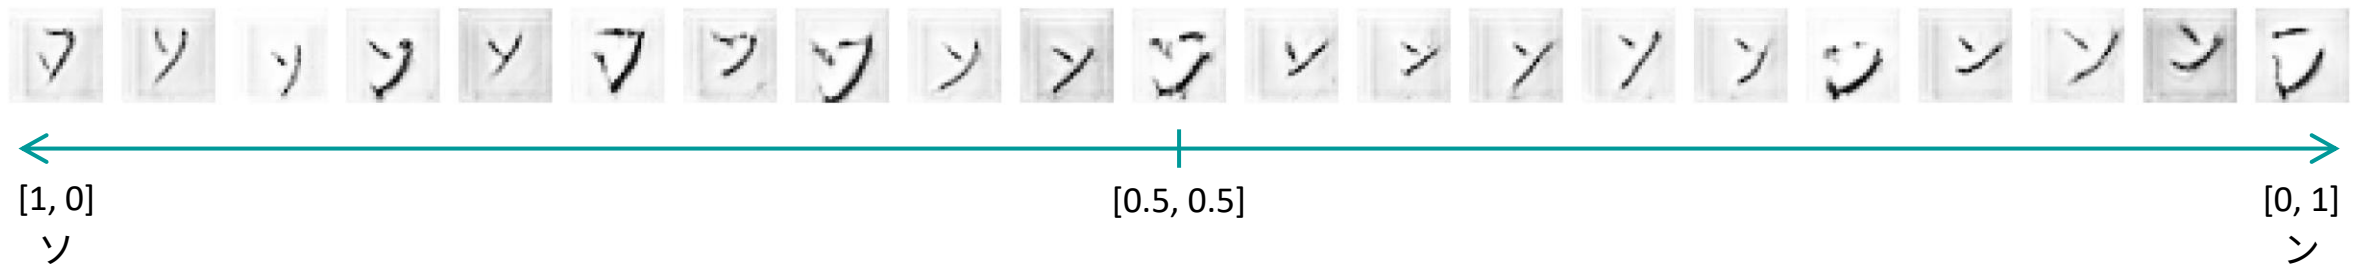

Generate images

Result:

I gave labels and noise vectors to the trained generator and got below

```
labels = np.array([[1-i*0.05, i*0.05] for i in range(20 + 1)])
```

Generated images

Conclusion

- likely to be judged by はらい
What will happen if I use images drawn with a ballpoint pen?
- Bending at the beginning of writing makes it easier to distinguish

Generated images with annotations
